

Aggregation

- ❖ Used when we have to model a relationship involving (entity sets and) a relationship set.

- Aggregation allows us to treat a relationship set as an entity set for purposes of participation in (other) relationships.

➡ Aggregation vs. ternary relationship:

- ❖ Monitors is a distinct relationship, with a descriptive attribute.
- ❖ Also, can say that each sponsorship is monitored by at most one employee.

Conceptual Design Using the ER Model

❖ Design choices:

- Should a concept be modeled as an entity or an attribute?
- Should a concept be modeled as an entity or a relationship?
- Identifying relationships: Binary or ternary? Aggregation?

❖ Constraints in the ER Model:

- A lot of data semantics can (and should) be captured.
- But some constraints cannot be captured in ER diagrams.

Entity vs. Attribute

- ❖ Should *address* be an attribute of Employees or an entity (connected to Employees by a relationship)?
- ❖ Depends upon the use we want to make of address information, and the semantics of the data:
 - If we have *several* addresses per employee, *address* must be an entity (since attributes cannot be set-valued).
 - If the structure (city, street, etc.) is important, e.g., we want to retrieve employees in a given city, *address* must be modeled as an entity (since attribute values are atomic).

Entity vs. Attribute (Contd.)

- ❖ Works_In4 does not allow an employee to work in a department for two or more periods.

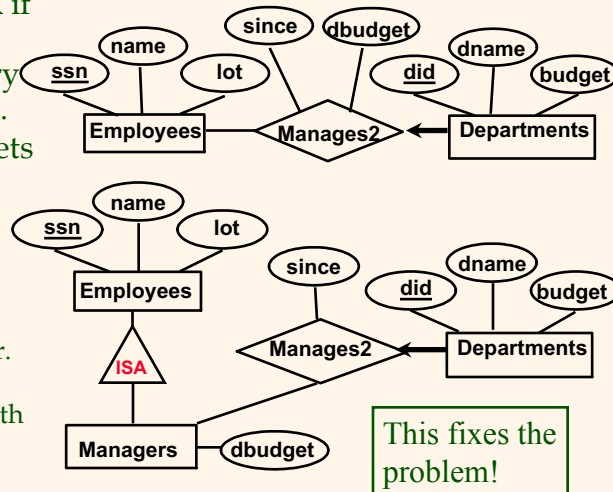

- ❖ Similar to the problem of wanting to record several addresses for an employee: We want to record *several values of the descriptive attributes for each instance of this relationship*. Accomplished by introducing new entity set, Duration.

Entity vs. Relationship

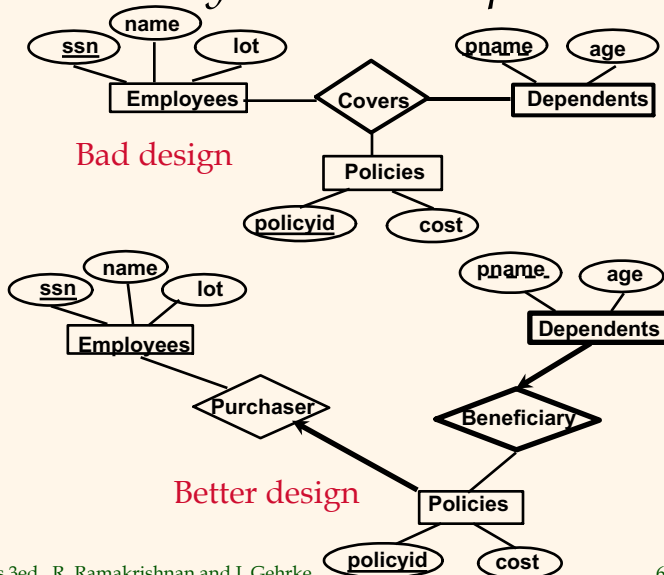

- ❖ First ER diagram OK if a manager gets a separate discretionary budget for each dept.
- ❖ What if a manager gets a discretionary budget that covers *all* managed depts?

- **Redundancy:** *dbudget* stored for each dept managed by manager.
- **Misleading:** Suggests *dbudget* associated with department-mgr combination.

Binary vs. Ternary Relationships

- ❖ If each policy is owned by **just 1** employee, and each dependent is tied to the covering policy, first diagram is inaccurate.

Binary vs. Ternary Relationships (Cont.)

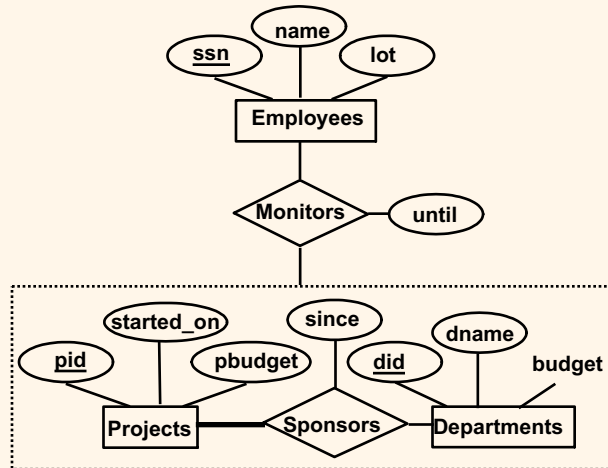

- ❖ A policy cannot be owned jointly by two or more employees.
- ❖ Every policy must be owned by some employee.
- ❖ Dependent is a weak entity set, and each dependent entity is uniquely identified by taking *pname* in conjunction with the *policyid* of a policy entity.

Binary vs. Ternary Relationships (Cont.)

- ❖ Previous example illustrated a case when two binary relationships were better than one ternary relationship.
- ❖ An example in the other direction: a ternary relation **Contracts** relates entity sets **Parts**, **Departments** and **Suppliers**, and has a descriptive attribute *qty*. No combination of binary relationships is an adequate substitute:
 - S “can-supply” P, D “needs” P, and D “deals-with” S does not imply that D has agreed to buy P from S.
 - How do we record *qty*?

Aggregation vs. Ternary Relationships

Summary of Conceptual Design

- ❖ *Conceptual design follows requirements analysis,*
 - Yields a high-level description of data to be stored
- ❖ ER model popular for conceptual design
 - Constructs are expressive, close to the way people think about their applications.
- ❖ Basic constructs: *entities, relationships, and attributes* (of entities and relationships).
- ❖ Some additional constructs: *weak entities, ISA hierarchies, and aggregation.*
- ❖ Note: There are many variations on ER model.

Summary of ER (Contd.)

- ❖ Several kinds of integrity constraints can be expressed in the ER model: *key constraints*, *participation constraints*, and *overlap/covering constraints* for ISA hierarchies. Some *foreign key constraints* are also implicit in the definition of a *relationship set*.
 - Some constraints (notably, *functional dependencies*) cannot be expressed in the ER model.
 - Constraints play an important role in determining the best database design for an enterprise.

Summary of ER (Contd.)

- ❖ ER design is *subjective*. There are often many ways to model a given scenario! Analyzing alternatives can be tricky, especially for a large enterprise. Common choices include:
 - Entity vs. attribute, entity vs. relationship, binary or n-ary relationship, whether or not to use ISA hierarchies, and whether or not to use aggregation.
- ❖ Ensuring good database design: resulting relational schema should be analyzed and refined further. FD information and normalization techniques (Chapter 19) are especially useful.
